# Review: Database Design

- Requirements Analysis
  - user needs; what must database do?
- Conceptual Design
  - high level descr (often done w/ER model)
- Logical Design
  - translate ER into DBMS data model
- Schema Refinement
  - consistency, normalization
- Physical Design - indexes, disk layout
- Security Design - who accesses what

# The Purpose of Normalization

**Database normalization** is the process of removing redundant data from your tables in to improve storage efficiency, data integrity, and scalability

**The process of normalization** is a formal method that identifies relations based on their primary or candidate keys and the functional dependencies among their attributes.

# Update Anomalies

Relations that have redundant data may have problems called **update anomalies**, which are classified as ,

Insertion anomalies

Deletion anomalies

Modification anomalies

# Example of Update Anomalies

To insert a new staff with branchNo B007 into the StaffBranch relation;

To delete a tuple that represents the last member of staff located at a branch B007;

To change the address of branch B003.

**StaffBranch**

| staffNo | sName       | position   | salary | branchNo | bAddress               |

# Functional Dependencies

**Functional dependency** describes the relationship between attributes in a relation.

For example, if A and B are attributes of relation R, and B is functionally dependent on A (denoted  $A \rightarrow B$ ), if each value of A is associated with exactly one value of B. (A and B may each consist of one or more attributes)

**Determinant**

Refers to the attribute or group of attributes on the left-hand side of the arrow of a functional dependency

# Functional Dependencies

**Trivial functional dependency** means that the right-hand side is a subset ( not necessarily a proper subset) of the left-hand side.

For example:

$\text{staffNo, sName} \rightarrow \text{sName}$

$\text{staffNo, sName} \rightarrow \text{staffNo}$

They do not provide any additional information about possible integrity constraints on the values held by these attributes.

We are normally more interested in **nontrivial dependencies** because they represent integrity constraints for the relation.

# Functional Dependencies

Main characteristics of functional dependencies in normalization :

- Have a **one-to-one** relationship between attribute(s) on the left- and right- hand side of a dependency;
- hold for **all time**;
- are completely **nontrivial**.

# Specifying FD's for a Relation

- Armstrong's Interference Rules
- Closure set of Attributes
- Closure set of FD's

# Amstrong's Interference Rules

- **Armstrong's Axioms** ( $X, Y, Z$  are sets of attributes):
  - Reflexivity: If  $X \supseteq Y$ , then  $X \rightarrow Y$
  - Augmentation: If  $X \rightarrow Y$ , then  $XZ \rightarrow YZ$   
for any  $Z$
  - Transitivity: If  $X \rightarrow Y$  and  $Y \rightarrow Z$ , then  $X \rightarrow Z$
- These are *sound* and *complete* inference rules for FDs!
  - i.e., using AA you can compute all the FDs in  $F^+$  and only these FDs.
- Some additional rules (that follow from AA):
  - *Union*: If  $X \rightarrow Y$  and  $X \rightarrow Z$ , then  $X \rightarrow YZ$
  - *Decomposition*: If  $X \rightarrow YZ$ , then  $X \rightarrow Y$  and  $X \rightarrow Z$
  - *Composition*: If  $X \rightarrow Y$ , and  $Z \rightarrow A$ , Then  $XZ \rightarrow YA$
  - **Self-determination**:  $X \rightarrow X$

# Closure Set of Attributes

- Computing the closure of a set of FDs can be expensive.
- Typically, we just want to check if a given FD  $X \rightarrow Y$  is in the closure of a set of FDs  $F$ . An efficient check:
  - Compute attribute closure of  $X$  (denoted  $X^+$ ) wrt  $F$ .  
 $X^+ =$  Set of all attributes  $A$  such that  $X \rightarrow A$  is in  $F^+$ 
    - $X^+ := X$
    - Repeat until no change: if there is an fd  $U \rightarrow V$  in  $F$  such that  $U$  is in  $X^+$ , then add  $V$  to  $X^+$
  - Check if  $Y$  is in  $X^+$
  - Approach can also be used to find the keys of a relation.
    - If all attributes of  $R$  are in the closure of  $X$  then  $X$  is a superkey for  $R$ .
    - Q: How to check if  $X$  is a “candidate key”?

# Algorithm to compute Closure

- Let  $X$  be a set of attributes that will become closure
- Now repeatedly search for all FD's of the form  $X \rightarrow Y$  such that  
If  $X$  is a part of closure but  $Y$  is not a part of closure, then add  $Y$  to the closure
- Repeat above step, as many times as necessary until no more attributes can be added
- Then, set  $X$  will become a closure set of attributes

## Example :

■ Given FD's are

■  $A \rightarrow B$       Compute  $A^+$

$B \rightarrow C$

$X = A$

$C \rightarrow E$

$= AB$

$F \rightarrow G$

$= ABC$

$= ABCE$

**$A^+ = ABCE$  ,  $A \rightarrow ABCE$**

# Applications of Closure of Attributes

- It is used to identify additional FD's
- It is used to identify candidate keys for the relation
  - If any closure cover all the attributes, it acts as a key
- It is used to find out equivalences of FD's
- It is used to identify Irreducible set of FD's or canonical form of FD's

# Functional Dependencies

## Identifying the primary key

**Functional dependency** is a property of the meaning or semantics of the attributes in a relation. When a functional dependency is present, the dependency is specified as a **constraint** between the attributes.

An important integrity constraint to consider first is **the identification of candidate keys, one of which is selected to be the primary key** for the relation using functional dependency.

# Attribute Closure (example)

■  $R = \{A, B, C, D, E\}$

■  $F = \{B \rightarrow CD, D \rightarrow E, B \rightarrow A, E \rightarrow C, AD \rightarrow B\}$

■ Is  $B \rightarrow E$  in  $F^+$  ?

$B^+ = B$

$B^+ = BCD$

$B^+ = BCDA$

$B^+ = BCDAE \dots$

and B is a key for R too!

■ Is D a key for R?

$D^+ = D$

$D^+ = DE$

$D^+ = DEC$

... No

• Is AD a key for R?

$AD^+ = AD$

$AD^+ = ABD$  and B is a key

• Is AD a *candidate* key for R?

$A^+ = A, D^+ = DEC$

... A, D not keys

• Is ADE a *candidate* key for R?

... No! AD is a key, so ADE is a superkey, but not a cand. key

$ADE^+ = ADE \cup B$

# Equivalences of FD's

- Consider two set of FD's like F1 and F2

They are considered as Equivalent if  
Closure of F1 = Closure of F2

i.e, Every FD's in F1 can be derived from F2 and Every FD's in F2 can be Derived from F1

# Example

**F**

A  $\rightarrow$  C  
AC  $\rightarrow$  D  
E  $\rightarrow$  AD  
E  $\rightarrow$  H

**G**

A  $\rightarrow$  CD  
E  $\rightarrow$  AH

## ■ Steps:

- Take G set and compute Closure from F. Test whether they can be implied
- Take F set and compute Closure from G. Test whether they can be implied

# Example

■ G :

$$A^+ = ACD \text{ (} A \rightarrow CD \text{)}$$

$$E^+ = EADH \text{ (} E \rightarrow AH \text{)}$$

All the FD's of G can be derived from F.

■ F :

$$A^+ = ACD \text{ (} A \rightarrow C \text{)}$$

$$AC^+ = ACD \text{ (} AC \rightarrow D \text{)}$$

$$E^+ = EACDH \text{ (} E \rightarrow AD, E \rightarrow H \text{)}$$

All the FD's of F can be derived from G.

**F is Equivalent to G**

# Minimal Sets of Functional Dependencies

A set of functional dependencies  $X$  is **minimal** if it satisfies the following condition:

- Every dependency in  $X$  has a single attribute on its right-hand side
- We cannot replace any dependency  $A \rightarrow B$  in  $X$  with dependency  $C \rightarrow B$ , where  $C$  is a proper subset of  $A$ , and still have a set of dependencies that is equivalent to  $X$ .
- We cannot remove any dependency from  $X$  and still have a set of dependencies that is equivalent to  $X$ .

# Steps to Identify the Irreducible set

1. Try to have single attribute on RHS.
2. Remove the inessential FD's like  $X \rightarrow A$ , Then Compute  $X^+$  from the remaining FD's and check whether this  $X^+$  includes A. If it is true, then removal of  $X \rightarrow A$  will not have any influence in the database design.
3. If LHS consists multiple attributes like  $XY \rightarrow Z$ , remove X and compute  $Y^+$ , or remove Y and compute  $X^+$  from the available FD's. If they have equal attributes, then removal of these attributes will not have any influence.
4. Apply Union rule to the common LHS attribute

# Example :

A -> B  
C -> B  
D -> ABC  
AC -> D

## Step 1 :

A -> B ----- 1

C -> B ----- 2

D -> A ----- 3

D -> B ----- 4

D -> C ----- 5

AC -> D ----- 6

## Step 2 :

- Remove 1 { compute  $A^+$  from 2,3,4,5,6 }

$A^+ = A$  ----- Can't remove 1

- Remove 2 {compute  $C^+$  from 1,3,4,5,6 }

$C^+ = C$  ----- Can't remove 2

- Remove 3 {compute  $D^+$  from 1,2,4,5,6 }

$D^+ = DBC$  ----- Can't remove 3

- Remove 4 {compute  $D^+$  from 1,2,3,5,6 }

$D^+ = DABC$  ---- Can remove 4

- Remove 5 {compute  $D^+$  from 1,2,3,4,6 }

$D^+ = DAB$  ----- Can't remove 5

## Step 3 :

A  $\rightarrow$  B  
C  $\rightarrow$  B  
D  $\rightarrow$  A  
D  $\rightarrow$  C  
AC  $\rightarrow$  D

$C^+ = CB, A^+ = AB,$

- Remove A from 6, Compute  $C^+$  .

$C^+ = CDAB$

- Remove C from 6, Compute  $A^+$  .

$A^+ = CDAB$

Can't remove A or C.

# Canonical Form of FD

$A \rightarrow B$   
 $C \rightarrow B$   
 $D \rightarrow A$   
 $D \rightarrow C$   
 $AC \rightarrow D$

## Example of A Minial Sets of Functional Dependencies

A set of functional dependencies for the StaffBranch Relation satisfies the three conditions for producing a minimal set.

$\text{staffNo} \rightarrow \text{sName}$

$\text{staffNo} \rightarrow \text{position}$

$\text{staffNo} \rightarrow \text{salary}$

$\text{staffNo} \rightarrow \text{branchNo}$

$\text{staffNo} \rightarrow \text{bAddress}$

$\text{branchNo} \rightarrow \text{bAddress}$

$\text{branchNo}, \text{position} \rightarrow \text{salary}$

$\text{bAddress}, \text{position} \rightarrow \text{salary}$

# Types Of Functional Dependencies

- Partial
- Transitive
- Full

# Partial Functional Dependency

- One or two non-key attributes functionally dependent on a part of Primary key.
- Whenever there is a P.D, it causes redundancy and retrival problem.

Ex:  $AB \rightarrow C$       $R=ABCD$ ,

$B \rightarrow D$

$AB^+ = ABCD$  ---->  $AB$  is the Key

$B \rightarrow D$  :  $D$  (Non key) depends on  $B$  ( part of key)

Hence , P.D

## Conditions for No P.D :

Under the Following Conditions,  
there is no P.D :

- If P.key consists of only one attribute.
- If table consists of only two attribute
- If all the attributes of the table forms the P.key of the table

# Transitive Functional Dependency

- If one non-key attribute determines another non-key attributes, then T.D
- Each attributes must depend directly on the primary key; all attributes that are not dependant upon the primary key must be eliminated

■ Ex:  $AB \rightarrow C$   $R=ABCDE$

■  $B \rightarrow D$   $P \rightarrow D$

■  $C \rightarrow E$   $T \rightarrow D$

$A \rightarrow B$

$B \rightarrow C$

$AB^+ = ABCDE$  ----  $AB$  is the Key

$C, D, E$  ---- Non key attributes

Hence , T.D

## Conditions for No T.D :

Under the Following Conditions,  
there is no T.D :

- If all the attributes in the Relation are part of the P.Key.
- If the Relation consists of only two attributes

## Full functional dependency

**Full functional dependency** indicates that if A and B are attributes of a relation, B is fully functionally dependent on A if B is functionally dependent on A, but not on any proper subset of A.

A functional dependency  $A \rightarrow B$  is **partially dependent** if there is some attributes that can be removed from A and the dependency still holds.

# The Process of Normalization

- **Normalization** is often executed as a series of steps. Each step corresponds to a specific normal form that has known properties.
- As normalization proceeds, the relations become progressively more restricted in format, and also less vulnerable to update anomalies.
- For the relational data model, it is important to recognize that it is only first normal form (1NF) that is critical in creating relations. All the subsequent normal forms are optional.

# First Normal Form (1NF)

Repeating group = (propertyNo, pAddress, rentStart, rentFinish, rent, ownerNo, oName)

ing groups.

| ClientNo | cName         | propertyNo | pAddress              | rentStart | rentFinish | rent | ownerNo | oName       |
|----------|---------------|------------|-----------------------|-----------|------------|------|---------|-------------|

| CR56     | Aline Stewart | PG4        | 6 lawrence St,Glasgow | 1-Sep-99  | 10-Jun-00  | 350  | CO40    | Tina Murphy |
|          |               | PG36       | 2 Manor Rd, Glasgow   | 10-Oct-00 | 1-Dec-01   | 370  | CO93    | Tony Shaw   |
|          |               | PG16       | 5 Novar Dr, Glasgow   | 1-Nov-02  | 1-Aug-03   | 450  | CO93    | Tony Shaw   |

# Definition of First Normal Form (1NF)

1. The cells of the table must have a single value.
2. Neither repeating groups nor arrays are allowed as values.
3. All entries in any column must be of the same kind.
4. Each column must have a unique name
5. No two rows in a table are identical

# 1NF (Continue ...)

**First Normal Form** is a relation in which the intersection of each row and column contains one and only one value.

There are two approaches to removing repeating groups from unnormalized tables:

1. Removes the repeating groups by entering appropriate data in the empty columns of rows containing the repeating data.
2. Removes the repeating group by placing the repeating data, along with a copy of the original key attribute(s), in a separate relation.  
A primary key is identified for the new relation.

# 1NF ClientRental relation with the first approach

With the first approach, we remove the repeating group (property rented details) by entering the appropriate client data into each row.  
The ClientRental relation is defined as follows,  
**ClientRental ( clientNo, propertyNo, cName, pAddress, rentStart, rentFinish, rent, ownerNo, oName)**

| ClientNo | propertyNo | cName         | pAddress              | rentStart | rentFinish | rent | ownerNo | oName       |
|----------|------------|---------------|-----------------------|-----------|------------|------|---------|-------------|
| CR76     | PG4        | John Kay      | 6 lawrence St,Glasgow | 1-Jul-00  | 31-Aug-01  | 350  | CO40    | Tina Murphy |
| CR76     | PG16       | John Kay      | 5 Novar Dr, Glasgow   | 1-Sep-02  | 1-Sep-02   | 450  | CO93    | Tony Shaw   |
| CR56     | PG4        | Aline Stewart | 6 lawrence St,Glasgow | 1-Sep-99  | 10-Jun-00  | 350  | CO40    | Tina Murphy |
| CR56     | PG36       | Aline Stewart | 2 Manor Rd, Glasgow   | 10-Oct-00 | 1-Dec-01   | 370  | CO93    | Tony Shaw   |
| CR56     | PG16       | Aline Stewart | 5 Novar Dr, Glasgow   | 1-Nov-02  | 1-Aug-03   | 450  | CO93    | Tony Shaw   |

# 1NF ClientRental relation with the second approach

With the second approach, we remove the repeating group (property rented details) by placing the repeating data along with the original key attribute (clientNo) in a separate relation.

| ClientNo | cName         |
|----------|---------------|
| CR76     | John Kay      |
| CR56     | Aline Stewart |

| ClientNo | propertyNo | pAddress              | rentStart | rentFinish | rent | ownerNo | oName       |
|----------|------------|-----------------------|-----------|------------|------|---------|-------------|
| CR76     | PG4        | 6 lawrence St,Glasgow | 1-Jul-00  | 31-Aug-01  | 350  | CO40    | Tina Murphy |
| CR76     | PG16       | 5 Novar Dr, Glasgow   | 1-Sep-02  | 1-Sep-02   | 450  | CO93    | Tony Shaw   |
| CR56     | PG4        | 6 lawrence St,Glasgow | 1-Sep-99  | 10-Jun-00  | 350  | CO40    | Tina Murphy |
| CR56     | PG36       | 2 Manor Rd, Glasgow   | 10-Oct-00 | 1-Dec-01   | 370  | CO93    | Tony Shaw   |
| CR56     | PG16       | 5 Novar Dr, Glasgow   | 1-Nov-02  | 1-Aug-03   | 450  | CO93    | Tony Shaw   |

## Definition of Second Normal Form (2NF) : Partial Dependencies

- Anomalies can occur when attributes are dependent on only part of a multi-attribute key
- A relation is in 2NF, when all Non-Key attributes are dependent on the whole key.
- No attribute is dependent on only a part of key
- Any relation having a single attribute is in 2NF

## Second Normal Form (2NF)

**Second normal form (2NF)** is a relation that is in first normal form and every non-primary-key attribute is fully functionally dependent on the primary key.

The normalization of 1NF relations to 2NF involves the removal of **partial dependencies**. If a partial dependency exists, we remove the function dependent attributes from the relation by placing them in a new relation along with a copy of their determinant.

## 2NF ClientRental relation

The ClientRental relation has the following functional dependencies:

fd1 : clientNo, propertyNo  $\rightarrow$  rentStart, rentFinish (Primary Key)

fd2 : clientNo  $\rightarrow$  cName (Partial dependency)

Fd3: propertyNo  $\rightarrow$  pAddress, rent, ownerNo, oName (Partial dependency)

Fd4: ownerNo  $\rightarrow$  oName (Transitive Dependency)

Fd5: clientNo, rentStart  $\rightarrow$  propertyNo, pAddress, rentFinish, rent, ownerNo, oName (Candidate key)

Fd6: propertyNo, rentStart  $\rightarrow$  clientNo, cName, rentFinish (Candidate key)

## 2NF ClientRental relation

After removing the partial dependencies, the creation of the three new relations called Client, Rental, and PropertyOwner

Client (clientNo, cName)  
Rental (clientNo, propertyNo, rentStart, rentFinish)  
PropertyOwner (propertyNo, pAddress, rent, ownerNo, oName)

Client

| ClientNo | cName         |
|----------|---------------|
| CR76     | John Kay      |
| CR56     | Aline Stewart |

Rental

| ClientNo | propertyNo | rentStart | rentFinish |
|----------|------------|-----------|------------|
| CR76     | PG4        | 1-Jul-00  | 31-Aug-01  |
| CR76     | PG16       | 1-Sep-02  | 1-Sep-02   |
| CR56     | PG4        | 1-Sep-99  | 10-Jun-00  |
| CR56     | PG36       | 10-Oct-00 | 1-Dec-01   |
| CR56     | PG16       | 1-Nov-02  | 1-Aug-03   |

PropertyOwner

| propertyNo | pAddress              | rent | ownerNo | oName       |
|------------|-----------------------|------|---------|-------------|
| PG4        | 6 lawrence St,Glasgow | 350  | CO40    | Tina Murphy |
| PG16       | 5 Novar Dr, Glasgow   | 450  | CO93    | Tony Shaw   |
| PG36       | 2 Manor Rd, Glasgow   | 370  | CO93    | Tony Shaw   |

Figure 6 2NF ClientRental relation

## Definition of Third Normal Form (3NF) : Transitive Dependencies

- Anomalies can occur when a relation contains one or more transitive dependencies
- A transitive dependency exists when  $A \rightarrow B$ . and A is not a part of Key.

# Third Normal Form (3NF)

A relation that is in 1NF and 2NF, and in which no non-primary-key attribute is **transitively** dependent on the primary key.

The normalization of 2NF relations to 3NF involves the removal of transitive dependencies by placing the attribute(s) in a new relation along with a copy of the determinant.

# Boyce-Codd Normal Form (BCNF)

A relation is in BCNF, if and only if, every determinant is a candidate key.

The difference between 3NF and BCNF is that for a Functional dependency  $A \rightarrow B$ , 3NF allows this dependency in a relation if B is a primary-key attribute and A is not a candidate key, whereas BCNF insists that for this dependency to remain in a relation, A must be a candidate key.

# Examples:

■  $R=ABCDEFGHIJ$

$AB \rightarrow C$

$A \rightarrow DE$

$B \rightarrow F$

$F \rightarrow GH$

$D \rightarrow IJ$

# Examples:

■ R=ABCDEFGHIJ

AB -> C

A -> DE ----- P.D

B -> F ----- P.D

F -> GH ----- T.D

D -> IJ ----- T.D

AB ----- > Key

Result : upto 3NF

ADE

BF

ABC

DIJ

FGH

# Examples:

## ■ R=ABCDEFGH

AB -> CEFGH

A -> D ————— P.D

F->G ————— T.D

**FB->H**

HBC->ADEFHG

FBC->ADE

## Upto 2NF

- $AB = P.Key$

**AD**  
**ABCEFGH**

Upto 3NF

AD  
FG  
ABCEFH

# Upto BCNF

**AD**  
**FG**  
**FBH**  
**ABCEF**

# Examples:

## ■ R=ABCDEFGG

BCD  $\rightarrow$  A

BC  $\rightarrow$  E

A  $\rightarrow$  F

F  $\rightarrow$  G

C  $\rightarrow$  D

A  $\rightarrow$  G

## Examples:

■  $R=ABCEDFGH$

$A \rightarrow BC$   
 $ABE \rightarrow CDGH$   
 $C \rightarrow GD$   
 $D \rightarrow G$   
 $E \rightarrow F$

## Examples:

■  $R=ABCEDFGH$

$A \rightarrow BC$

$ABE \rightarrow CDGH$

$C \rightarrow GD$

$D \rightarrow G$

$E \rightarrow F$

## Examples:

■  $R=ABCEDFGH$

$A \rightarrow BC$   
 $ABE \rightarrow CDGH$   
 $C \rightarrow GD$   
 $D \rightarrow G$   
 $E \rightarrow F$

# Fourth Normal Form (4NF)

## Multi-valued dependency (MVD)

represents a dependency between attributes (for example, A, B and C) in a relation, such that for each value of A there is a set of values for B and a set of value for C. However, the set of values for B and C are independent of each other.

**A multi-valued dependency can be further defined as being trivial or nontrivial.**

A MVD  $A \twoheadrightarrow B$  in relation R is defined as being trivial if

- B is a subset of A
- or
- $A \cup B = R$

A MVD is defined as being nontrivial if neither of the Two conditions is satisfied.

# Fourth Normal Form (4NF)

**A relation that is in Boyce-Codd normal form and  
Contains no nontrivial multi-valued dependencies.**

## Example : Emp

| <u>Emp_Name</u> | Emp_Skills | Emp_language |
|-----------------|------------|--------------|
| Hari            | C          | Punjabi      |
| Shyam           | Java       | Hindi        |
| Ram             | J2EE       | Gujrati      |
| Rahul           | J2ME       | Tamil        |

## Upto 4NF :

Emp\_Skills

| Emp_<br>Name | Emp_<br>Skills |
|--------------|----------------|
| Hari         | C              |
| Shyam        | java           |
| Ram          | J2EE           |
| Rahul        | J2ME           |

Emp\_Languages

| Emp_<br>Name | Emp_<br>Language |
|--------------|------------------|
| Hari         | Punjabi          |
| Shyam        | Hindi            |
| Ram          | Gujrati          |
| Rahul        | Tamil            |

# Lossless-join dependency

- A property of decomposition, which ensures that
- no spurious tuples are generated when relations are reunited through a natural join operation.

Example :

R

| A  | B  | C  |
|----|----|----|
| a1 | b1 | c1 |
| a2 | b2 | c2 |
| a3 | b1 | c3 |

# Example :

R

| <u>A</u> | B  | C  |
|----------|----|----|
| a1       | b1 | c1 |
| a2       | b2 | c2 |
| a1       | b3 | c3 |

R1

| A  | B  |
|----|----|
| a1 | b1 |
| a2 | b2 |
| a1 | b3 |

R2

| A  | C  |
|----|----|
| a1 | c1 |
| a2 | c2 |
| a1 | c3 |

■  $R1 \times R2$  :

| A  | B  | C  |
|----|----|----|
| a1 | b1 | c1 |
| a2 | b2 | c2 |
| a1 | b3 | c3 |
| a1 | b1 | c3 |
| a1 | b3 | c1 |

■  $R1 \times R2$  :

| A  | B  | C  |
|----|----|----|
| a1 | b1 | c1 |
| a2 | b2 | c2 |
| a1 | b3 | c3 |
| a1 | b1 | c3 |
| a1 | b3 | c1 |

■  $R1 \times R2$  :

**R**

| A  | B  | C  |
|----|----|----|
| a1 | b1 | c1 |
| a2 | b2 | c2 |
| a1 | b3 | c3 |
| a1 | b1 | c3 |
| a1 | b3 | c1 |

**Additional Tuples**

- Hence , Lossy Decomposition

- Ex :  $R(ABC)$ ,  
 $R_1(AB)$  ,  $R_2(AC)$   
 $B \rightarrow C$

$R_1 \wedge R_2 = A$

Check

$R_1 \wedge R_2 \rightarrow R_1 : A \rightarrow AB$

or

$R_1 \wedge R_2 \rightarrow R_2 : A \rightarrow AC$

If true, Lossless Decompsition,  
Else **Lossy Decomposition**

# Fifth Normal Form (5NF)

**A relation that has no join dependency.**

## **Join dependency**

**Describes a type of dependency. For example, for a relation  $R$  with subsets of the attributes of  $R$  denoted as  $A, B, \dots, Z$ , a relation  $R$  satisfies a join dependency if, and only if, every legal value of  $R$  is equal to the join of its projections on  $A, B, \dots, Z$ .**

## Example :

| Ambassador | Company   | Product     |
|------------|-----------|-------------|
| Amir       | Coca Cola | Coke        |
| Kareena    | Boroplus  | Cold Cream  |
| Katrina    | Coca Cola | Maaza       |
| Katrina    | Coca Cola | Coke        |
| Kareena    | Boroplus  | Body Lotion |

# FIFTH NORMAL FORM (5 NF)

| Ambassador | Company   |
|------------|-----------|
| Amir       | Coca Cola |
| Kareena    | Boroplus  |
| Katrina    | Coca Cola |

| Company   | Product     |
|-----------|-------------|
| Coca Cola | Coke        |
| Coca Cola | Maaza       |
| Boroplus  | Cold Cream  |
| Boroplus  | Body lotion |

| Ambassador | Product     |
|------------|-------------|
| Amir       | Coke        |
| Kareena    | Cold Cream  |
| Kareena    | Body lotion |
| Katrina    | Coke        |
| Katrina    | Maaza       |

A vertical strip of four images on the left side of the slide. From top to bottom: a blue clock face on a blue background, a red clock face on a red background, a green open book on a green background, and a blue open book on a blue background.

# Advantages of Normalization

- It reduces the redundancy within a table
- Increases Consistency

# Disadvantages of Normalization

- It can not detect redundancy between the relations
- The Fragmented relation from the normalization process may not have real world Meaning
- It slows down the query retrieval process because it requires Join and subqueries

THE END
