

# Requirements Analysis and Specification

⌘ Many projects fail:

☒ because they start implementing the system without determining whether they are building what the customer really wants.

# Requirements Analysis and Specification

⌘ Goals of requirements analysis and specification phase:

- ☑ fully understand the user requirements

- ☑ remove inconsistencies, anomalies, etc. from requirements

- ☑ document requirements properly in an SRS document

# Requirements Analysis and Specification

⌘ Consists of two distinct activities:

- ☒ Requirements Gathering and Analysis

- ☒ Specification

# Requirements Analysis and Specification

- ⌘ The person who undertakes requirements analysis and specification:
  - ☐ known as **systems analyst**:
  - ☐ collects data pertaining to the product
  - ☐ analyzes collected data:
    - ☒ to understand what exactly needs to be done.
  - ☐ writes the **Software Requirements Specification (SRS)** document.

# Requirements Analysis and Specification

⌘ Final output of this phase:

☒ Software Requirements Specification (SRS) Document.

⌘ The SRS document is reviewed by the customer.

☒ reviewed SRS document forms the basis of all future development activities.

# Requirements Gathering

⌘ Analyst gathers requirements through:

- ☑ observation of existing systems,
- ☑ studying existing procedures,
- ☑ discussion with the customer and end-users,
- ☑ analysis of what needs to be done, etc.

# Requirements Gathering

(CONT.)

⌘ In the absence of a working system,

☑ lot of imagination and creativity are required.

⌘ Interacting with the customer to gather relevant data:

☑ requires a lot of experience.

# Requirements Gathering

(CONT.)

⌘ Some desirable attributes of a good system analyst:

☑ Good interaction skills,

☑ imagination and creativity,

☑ experience.

# Analysis of the Gathered Requirements

- ⌘ After gathering all the requirements:
  - ☐ analyze it:
    - ☒ Clearly understand the user requirements,
    - ☒ Detect inconsistencies, ambiguities, and incompleteness.
- ⌘ Incompleteness and inconsistencies:
  - ☐ resolved through further discussions with the end-users and the customers.

# Inconsistent requirement

⌘ Some part of the requirement:

☐ contradicts with some other part.

⌘ Example:

☐ One customer says turn off heater and open water shower when temperature  $> 100\text{ }^{\circ}\text{C}$

☐ Another customer says turn off heater and turn ON cooler when temperature  $> 100\text{ }^{\circ}\text{C}$

# Incomplete requirement

⌘ Some requirements have been omitted:

☐ due to oversight.

⌘ Example:

☐ The analyst has not recorded:  
when temperature falls below 90 C

☒ heater should be turned ON

☒ water shower turned OFF.

# Analysis of the Gathered Requirements (CONT.)

⌘ Requirements analysis involves:

- ☑ obtaining a clear, in-depth understanding of the product to be developed,

- ☑ remove all ambiguities and inconsistencies.

# Analysis of the Gathered Requirements<sub>(CONT.)</sub>

⌘ Several things about the project should be clearly understood by the analyst:

☐ What is the problem?

☐ Why is it important to solve the problem?

☐ What are the possible solutions to the problem?

☐ What complexities might arise while solving the problem?

# Analysis of the Gathered Requirements<sub>(CONT.)</sub>

- ⌘ After collecting all data regarding the system to be developed,
  - ☐ remove all inconsistencies and anomalies from the requirements,
  - ☐ systematically organize requirements into a Software Requirements Specification (SRS) document.

# Software Requirements Specification

⌘ Main aim of requirements specification:

- ☑ systematically organize the requirements arrived during requirements analysis

- ☑ document requirements properly.

# Software Requirements Specification

⌘ The SRS document is useful in various contexts:

- ☑ statement of user needs
- ☑ contract document
- ☑ reference document
- ☑ definition for implementation

# Software Requirements Specification: A Contract Document

⌘ Requirements document is a reference document.

⌘ SRS document is a contract between the development team and the customer.

☑ Once the SRS document is approved by the customer,

☒ any subsequent controversies are settled by referring the SRS document.

# Software Requirements Specification: A Contract Document

⌘ Once customer agrees to the SRS document:

☑ development team starts to develop the product according to the requirements recorded in the SRS document.

⌘ The final product will be acceptable to the customer:

☑ as long as it satisfies all the requirements recorded in the SRS document.

# SRS Document (CONT.)

⌘ The SRS document is known as black-box specification:

- ☑ the system is considered as a black box whose internal details are not known.
- ☑ only its visible external (i.e. input/output) behaviour is documented.

# SRS Document (CONT.)

⌘ SRS document concentrates on:

- ☑ what needs to be done

- ☑ carefully avoids the solution ("how to do") aspects.

⌘ The SRS document serves as a contract

- ☑ between development team and the customer.

- ☑ Should be carefully written

# SRS Document (CONT.)

- ⌘ The requirements at this stage:
  - ☑ written using end-user terminology.
- ⌘ later a formal requirement specification may be developed from it.

# Properties of a good SRS document

- ⌘ It should be concise
  - ☐ and at the same time should not be ambiguous.
- ⌘ It should specify what the system must do
  - ☐ and not say how to do it.
- ⌘ Easy to change.,
  - ☐ i.e. it should be well-structured.
- ⌘ It should be consistent.
- ⌘ It should be complete.

# Properties of a good SRS document (cont...)

⌘ It should be traceable

☑ you should be able to trace which part of the specification corresponds to which part of the design and code, etc and vice versa.

⌘ It should be verifiable

☑ e.g. "system should be user friendly" is not verifiable

# SRS Document (CONT.)

- 
- ⌘ SRS document, normally contains three important parts:
- ☑ functional requirements,
  - ☑ Non functional requirements,
  - ☑ constraints on the system.

# SRS Document (CONT.)

⌘ It is desirable to consider every system:

- ☒ performing a set of functions  $\{f_i\}$ .
- ☒ Each function  $f_i$  considered as:
- ☒ transforming a set of input data to corresponding output data.

# Example: Functional Requirement

## ⌘ F1: Search Book

☐ Input:

☒ an author's name:

☐ Output:

☒ details of the author's books and the locations of these books in the library.

# Functional Requirements

⌘ Functional requirements describe:

- ☑ A set of high-level requirements
- ☑ Each high-level requirement:
  - ☒ takes in some data from the user
  - ☒ outputs some data to the user
- ☑ Each high-level requirement:
  - ☒ might consist of a set of identifiable functions

# Functional Requirements

- ⌘ For each high-level requirement:
  - ☑ every function is described in terms of
    - ☒ input data set
    - ☒ output data set
    - ☒ processing required to obtain the output data set from the input data set

# Nonfunctional Requirements

⌘ Characteristics of the system which can not be expressed as functions:

- ☒ maintainability,
- ☒ portability,
- ☒ usability, etc.

# Nonfunctional Requirements

⌘ Nonfunctional requirements include:

- ☑ reliability issues,
- ☑ performance issues,
- ☑ human-computer interface issues,
- ☑ Interface with other external systems,
- ☑ security, maintainability, etc.

# Constraints

⌘ Constraints describe things that the system should or should not do.

☐ For example,

☒ standards compliance

☒ how fast the system can produce results

- so that it does not overload another system to which it supplies data, etc.

# Examples of constraints

- ⌘ Hardware to be used,
- ⌘ Operating system
  - ⌘ or DBMS to be used
- ⌘ Capabilities of I/O devices
- ⌘ Standards compliance
- ⌘ Data representations
  - ⌘ by the interfaced system

# Organization of the SRS Document

- ⌘ Introduction.

- ⌘ Functional Requirements

- ⌘ Nonfunctional Requirements

  - ☒ External interface requirements

  - ☒ Performance requirements

- ⌘ Constraints

# Example Functional Requirements

⌘ List all functional requirements  
    ☑ with proper numbering.

⌘ Req. 1:

    ☑ Once the user selects the “search” option,

        ☒ he is asked to enter the key words.

    ☑ The system should output details of all books

        ☒ whose title or author name matches any of the key words entered.

        ☒ Details include: Title, Author Name, Publisher name, Year of Publication, ISBN Number, Catalog Number, Location in the Library.

# Example Functional Requirements

## ⌘ Req. 2:

- ☑ When the “renew” option is selected,
  - ☒ the user is asked to enter his membership number and password.
- ☑ After password validation,
  - ☒ the list of the books borrowed by him are displayed.
- ☑ The user can renew any of the books:
  - ☒ by clicking in the corresponding renew box.

# Req. 1:

## ⌘ R.1.1:

⊞ Input: “search” option,

⊞ Output: user prompted to enter the key words.

## ⌘ R1.2:

⊞ Input: key words

⊞ Output: Details of all books whose title or author name matches any of the key words.

⊞ Details include: Title, Author Name, Publisher name, Year of Publication, ISBN Number, Catalog Number, Location in the Library.

⊞ Processing: Search the book list for the keywords

# Req. 2:

## ⌘ R2.1:

- ⊡ Input: "renew" option selected,
- ⊡ Output: user prompted to enter his membership number and password.

## ⌘ R2.2:

- ⊡ Input: membership number and password
- ⊡ Output:
  - ⊗ list of the books borrowed by user are displayed. User prompted to enter books to be renewed or
  - ⊗ user informed about bad password
- ⊡ Processing: Password validation, search books issued to the user from borrower list and display.

# Req. 2:

## ⌘ R2.3:

- ☑ **Input:** user choice for renewal of the books issued to him through mouse clicks in the corresponding renew box.
- ☑ **Output:** Confirmation of the books renewed
- ☑ **Processing:** Renew the books selected by the in the borrower list.

# Examples of Bad SRS Documents

## ⌘ Unstructured Specifications:

☒ Narrative essay --- one of the worst types of specification document:

- ☒ Difficult to change,
- ☒ difficult to be precise,
- ☒ difficult to be unambiguous,
- ☒ scope for contradictions, etc.

## ⌘ Forward References:

- ☒ References to aspects of problem
- ☒ defined only later on in the text.

# Examples of Bad SRS Documents

## ⌘ Overspecification:

- ☒ Addressing “how to” aspects
- ☒ For example, “Library member names should be stored in a sorted descending order”
- ☒ Overspecification restricts the solution space for the designer.

## ⌘ Contradictions:

- ☒ Contradictions might arise
  - ☒ if the same thing described at several places in different ways.

# Summary

## ⌘ Requirements analysis and specification

- ☐ an important phase of software development:

- ☐ any error in this phase would affect all subsequent phases of development.

## ⌘ Consists of two different activities:

- ☐ Requirements gathering and analysis

- ☐ Requirements specification

# Summary

⌘ The aims of requirements analysis:

- ☒ Gather all user requirements
- ☒ Clearly understand exact user requirements
- ☒ Remove inconsistencies and incompleteness.

⌘ The goal of specification:

- ☒ systematically organize requirements
- ☒ document the requirements in an SRS document.

# Summary

⌘ Main components of SRS document:

- ☑ functional requirements

- ☑ Non functional requirements

- ☑ constraints
