### Hamilton Paths and Circuits

A simple path in a graph  $G$  that passes through every vertex exactly once is called a *Hamilton path*, and a simple circuit in a graph  $G$  that passes through every vertex exactly once is called a *Hamilton circuit*. That is, the simple path  $x_0, x_1, \dots, x_{n-1}, x_n$  in the graph  $G = (V, E)$  is a Hamilton path if  $V = \{x_0, x_1, \dots, x_{n-1}, x_n\}$  and  $x_i \neq x_j$  for  $0 \leq i < j \leq n$ , and the simple circuit  $x_0, x_1, \dots, x_{n-1}, x_n, x_0$  (with  $n > 0$ ) is a Hamilton circuit if  $x_0, x_1, \dots, x_{n-1}, x_n$  is a Hamilton path.

#### Important points to remember

- If a graph has **pendant vertex**, then it **doesn't have Hamilton Circuit**.
- All edges corresponding to **degree 2 vertices** will always be considered for constructing Hamilton Circuit.
- **No more than two edges** will be used corresponding to any vertex in  $G$  for constructing Hamilton Circuit.
- Hamilton circuit **cannot contain smaller circuit** in it.

Q33. Determine whether the graphs has Hamilton Circuit, construct such if exists. If no, determine whether graph has Hamilton path, construct such if exists.

$a, b, d, e$  are vertices of degree 2 which leads to disconnected graph. If we consider  $\{c, f\}$  edge, it leads to more than two edges for  $c, f$ .

No Hamilton circuit,  $f \rightarrow$  pendant vertex. Hamilton path:  $a-b-c$ .

Hamilton Circuit

H.P.

## Shortest path Problems

Graphs that have a number assigned to each edge are called **Weighted Graphs**.

$$\begin{array}{l} \text{a to c} \left\{ \begin{array}{l} abc = 1+2=3 \\ ac = 4 \\ adc = 3+2=5 \end{array} \right. \end{array}$$

## Dijkstra's Algorithm

This is used to find the length of shortest path between any pair of vertices in a weighted connected simple graph  $G$ .

# ALGORITHM 1 Dijkstra's Algorithm.

**procedure** *Dijkstra*( $G$ : weighted connected simple graph, with all weights positive)  
 { $G$  has vertices  $a = v_0, v_1, \dots, v_n = z$  and lengths  $w(v_i, v_j)$  where  $w(v_i, v_j) = \infty$  if  $\{v_i, v_j\}$  is not an edge in  $G$ }  
**for**  $i := 1$  **to**  $n$   
      $L(v_i) := \infty$   
 $L(a) := 0$   
 $S := \emptyset$   
 {the labels are now initialized so that the label of  $a$  is 0 and all other labels are  $\infty$ , and  $S$  is the empty set}  
**while**  $z \notin S$   
      $u :=$  a vertex not in  $S$  with  $L(u)$  minimal  
      $S := S \cup \{u\}$   
     **for** all vertices  $v$  not in  $S$   
         **if**  $L(u) + w(u, v) < L(v)$  **then**  $L(v) := L(u) + w(u, v)$   
         {this adds a vertex to  $S$  with minimal label and updates the labels of vertices not in  $S$ }  
**return**  $L(z)$  { $L(z)$  = length of a shortest path from  $a$  to  $z$ }

(•) → vertex is closed from back side and open from front.

(X) → Path is cancelled.

To find shortest path b/w a and z

$$a - b - c - d - z = 7$$

Q34. Find the length of the shortest path between **a** and **z** in the given weighted graph.

$$\begin{array}{l|l|l}
 \begin{array}{l} a \\ \swarrow \searrow \\ \textcircled{b} \quad 4 \checkmark \\ \textcircled{c} \quad 3 \checkmark \end{array} & \begin{array}{l} \textcircled{c} \\ \swarrow \searrow \\ \textcircled{b} \quad 3+2=5 \textcircled{X} \\ \textcircled{d} \quad 3+3=6 \checkmark \\ \textcircled{e} \quad 3+6=9 \textcircled{X} \end{array} & \begin{array}{l} \textcircled{b} - d \quad 4+5=9 \textcircled{X} \end{array}
 \end{array}$$

$$\begin{array}{l|l}
 \begin{array}{l} \textcircled{d} \\ \swarrow \searrow \\ \textcircled{e} \quad 6+1=7 \checkmark \\ \textcircled{f} \quad 6+5=11 \checkmark \end{array} & \begin{array}{l} \textcircled{e} - \textcircled{g} \quad 7+5=12 \checkmark \end{array}
 \end{array}$$

$$\begin{array}{l|l}
 \begin{array}{l} \textcircled{f} \\ \swarrow \searrow \\ g \quad 9+11=20 \textcircled{X} \\ z \quad 7+11=18 \textcircled{X} \end{array} & \begin{array}{l} \textcircled{g} - \textcircled{z} \quad 12+4=16 \checkmark \end{array}
 \end{array}$$

$$a - c - d - e - g - z = 16$$

$$a - c - d - f = 11$$
