F-Test by Equality of two population variances'
Suppose are want to fest (1) whether two independent
Samples 20, (1=1,2,-n,) and y; (j=1,2,-n)
have been drawn from the normal populations certh
the same variance o2 (sag), or
D whether the two independent estimates at the
Onclar Hannel Inhall a Cara that
Onder the rull hypothesis (Ho) that
Ore equal
or, (1) Two independent estimates at the population
or, (1) Two independent estimates ab the population variance are homogeneous, the statistic F
$\frac{g_{\text{cuen by}}}{F = \frac{S_{x}^{2}}{S_{x}^{2}}} - F$
F = 5%
(*)
\frac{1}{S^2} \tag{\pi}
where $S_{\chi}^{2} = \frac{1}{n_{1}-1} \frac{\sum_{i=1}^{n_{1}} (x_{i}-\bar{x})^{2}}{n_{1}-1} \frac{\sum_{i=1}^{n_{2}} (x_{i}-\bar{x})^{2}}{\sum_{i=1}^{n_{2}-1} (x_{i}-\bar{x})^{2}}$
where $S_{\chi}^{2} = \int_{\eta_{1}-1}^{\eta_{1}} \frac{\chi_{1}-\chi_{2}}{\chi_{1}-1} \frac{\chi_{2}-\chi_{2}}{\chi_{2}-1}$ and $S_{\chi}^{2} = \int_{\eta_{2}-1}^{\eta_{2}} \frac{\chi_{2}-\chi_{2}}{\chi_{2}-1} \frac{\chi_{2}-\chi_{2}}{\chi_{2}-1}$ are unbiased estimates at the common population variance
where $S_{\chi}^{2} = \int_{\eta_{1}-1}^{\eta_{1}} (x_{1}-\overline{x})^{2}$ and $S_{y}^{2} = \int_{\eta_{2}-1}^{\eta_{2}} (x_{1}-\overline{x})^{2}$ are unbiased estimates at the common population variance obtained brown two independent samples and
where $S_{\chi}^{2} = \frac{1}{n_{1}-1} \frac{n_{1}}{e=1} (x_{i}-x)^{2}$ and $S_{y}^{2} = \frac{1}{n_{2}-1} \frac{n_{2}}{S=1} (y_{i}-y_{j})^{2}$ are unbiased estimates at the common population variance of obtained brown two independent samples and et bollows F -destribution conth (y_{1}, y_{2})
where $S_{\chi}^{2} = \int_{\eta_{1}-1}^{\eta_{1}} (x_{1}-\overline{x})^{2}$ and $S_{y}^{2} = \int_{\eta_{2}-1}^{\eta_{2}} (x_{1}-\overline{x})^{2}$ are unbiased estimates at the common population variance obtained brown two independent samples and
where $S_{\chi}^{2} = \frac{1}{n_{1}-1} \frac{n_{1}}{\varepsilon_{-1}} (x_{i}-\overline{x})^{2}$ and $S_{y}^{2} = \frac{1}{n_{2}-1} \frac{n_{2}}{\varepsilon_{-1}} (y_{j}-\overline{y})^{2}$ are unhiased estimates at the common population variance ε_{-1}^{2} obtained brown two independent samples and et bollows ε_{-1}^{2} destribution contra (y_{1}, y_{2}) degree at breedom certere $y_{1} = n_{1}-1$ and $y_{2} = n_{2}-1$
where $S_{\chi}^{2} = \frac{1}{n_{1}-1} \frac{n_{1}}{\varepsilon_{-1}} (x_{i}-\overline{x})^{2}$ and $S_{y}^{2} = \frac{1}{n_{2}-1} \frac{n_{2}}{\varepsilon_{-1}} (y_{j}-\overline{y})^{2}$ are unhiased estimates at the common population variance ε_{-1}^{2} obtained brown two independent samples and et bollows ε_{-1}^{2} destribution contra (y_{1}, y_{2}) degree at breedom certere $y_{1} = n_{1}-1$ and $y_{2} = n_{2}-1$
where $S_{\chi}^{2} = \frac{1}{n_{1}-1} \frac{n_{1}}{\varepsilon_{-1}} (x_{i}-\overline{x})^{2}$ and $S_{y}^{2} = \frac{1}{n_{2}-1} \frac{n_{2}}{\varepsilon_{-1}} (y_{j}-\overline{y})^{2}$ are unhiased estimates at the common population variance ε_{-1}^{2} obtained brown two independent samples and et bollows ε_{-1}^{2} destribution contra (y_{1}, y_{2}) degree at breedom certere $y_{1} = n_{1}-1$ and $y_{2} = n_{2}-1$
where $S_{\chi}^{2} = \frac{1}{n_{1}-i} \frac{N_{1}}{c=i} (x_{i}-x_{i})^{2}$ are unbiased estimates at the common population variance of obtained brown two independent samples and et bollows F -destribution with (N_{1},N_{2}) Degree at breedom where $N_{1}=n_{1}-1$ and $N_{2}=n_{2}-1$ Example Φ Remark In Φ , greater at the two variances $N_{1}=n_{2}-1$ And $N_{2}=n_{2}-1$ Fahen in the numerator and $N_{1}=n_{2}-1$ greater variance.
where $S_{\chi}^{2} = \frac{1}{N_{1}-1} \frac{N_{1}}{\ell=1} (x_{1}-x_{2})^{2}$ and $S_{y}^{2} = \frac{1}{N_{2}-1} \frac{N_{2}}{\ell=1} (y_{1}-y_{2})^{2}$ are unbiased estimates at the common population variance or obtained brown two independent samples and et bollows F -destribution with (y_{1}, y_{2})

Example D In one sample cet 8 observations, the our of equares ob deviations ab the sample values brown the sample mean was 84.4 and in the 1 Other cample ob 10 observations et was 102.6. Test achether this debberence is signeticant at 5% level, given shat the 5 percent point cel F bor n=7 and n=9 Legrees ob breedom is 3.29 Solution Here $n_1 = 8$, $n_2 = 10$, $\sum (x - \overline{x})^2 = 84.4$ $\sum (y-\bar{y})^2 = 102.6$ $S_{x}^{2} = \frac{1}{2} \sum_{x=1}^{2} (x-x)^{2} = \frac{1}{2} \times 84.4 = 12.057$ $S_{1}^{2} = \frac{1}{h_{2}-1} \sum (g-\overline{g})^{2} = \frac{1}{9} \times 102.6 = 11.4$ Under Ho; $G_1^2 = G_2^2 = \sigma^2$ i.e., the estimates ob $f = \frac{S_{x}^{2}}{S_{y}^{2}} = \frac{12.057}{11.4} = 1.057$ Tabulated F. bur (7,9) d.f is 3.29 Since calculated F < Foos; Ho may be accepted at 5% level ob significance. Example (2) Two random samples gave the bullowing results
Sample Size. Samplemean Samob squares. Sym ob squares ab deviations brom the mean

2 12 14 108

Test coelether the samply come brom the same normal population at 5% level ab significance.

Fo.05(9,11) = 2-90; Fo.05(11,9) = 3.10, to.05(20)=1.086, fo.05(21)=2.07
