Axioms of Probability

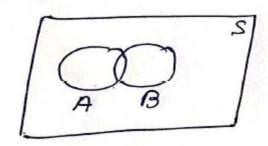

Axioms of Probability

(1) Let S be the sample space and A and B be two mutually exclusive events. Then

(11)
$$P(S) = 1$$

(2) Law of addition of Probabilities

If A and B are any two events associated with a random experiment, then $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

For, three events A, B and C $P(AUBUC) = P(A) + P(B) + P(C) - P(ANB) \cdot -P(BNC) - P(CNA) + P(ANBNC)$

- (3) If A is any event associated with an experiment, then $P(not A) = P(\overline{A}) = 1 P(A)$
- (4) If $A \subset B$, that is, the event A implies the event B, then $P(A) \leq P(B)$

Ex: Two dice are tussed once. Find the probability of getting an even number on the birst dice or a total of 8.

Sol: Debine the enents

A: Gretting an even number on the birst dice

B: Gretting a total of 8

 $A = \{(2, 1), ---(2, 6), (4, 1), ---(4, 6), (6, 0), ---(6, 6)\}$

 $B = \{(2,6), (3,5), (4,4), (5,3), (6,2)\}$

ANB = { (2,6), (4,4), (6,2)}

 $P(A) = \frac{18}{36} = \frac{1}{2}$, $P(B) = \frac{5}{36}$, $P(A \cap B) = \frac{3}{36} = \frac{1}{12}$

P(AUB) = P(A) + P(B) - P(ANB)

 $=\frac{1}{2}+\frac{5}{36}-\frac{1}{12}=\frac{5}{9}$

Ex: From a pack of well shubbled cards, one card is drawn. Find the probability that this card is either a king or an ace.

(a) $\frac{1}{13}$ (b) $\frac{2}{13}$ (c) $\frac{3}{13}$ (d) $\frac{4}{13}$

Sol: A; card drawn is king

B: Card drawn is an ace

The events A and B are mutually exclusive

$$P(A) = \frac{4}{52} = \frac{1}{13}$$
, $P(B) = \frac{4}{52} = \frac{1}{13}$

$$P(A \cup B) = P(A) + P(B) = \frac{1}{13} + \frac{1}{13} = \frac{2}{13}$$

(3) A bag contains 4 red and 3 black balls. A second bag contains 2 red and 4 black balls. One bag a selected at random. From the selected bag one ball is drawn. Find the probability that the ball drawn is red.

Sol: Required probability = $\frac{1}{2} \cdot \frac{4}{7} + \frac{1}{2} \cdot \frac{1}{3} = \frac{19}{42}$

Ex: If A, B, C are mutually exclusive and exhaustive events associated with a random experiment and P(B) = (0.6)(P(A)) and P(C) = (0.2)(P(A)) then bind P(A)

(a) $\frac{1}{g}$ (b) $\frac{4}{g}$ (c) $\frac{5}{g}$ (d) none of thuse

Sol:
$$P(A) + P(I3) + P(C) = 1$$

 $\Rightarrow P(A) + (0.6) P(A) + (0.2) P(A) = 1$
 $\Rightarrow P(A) (1 + 0.6 + 0.2) = 1$
 $\Rightarrow P(A) = \frac{1}{1.8} = \frac{10}{18} = \frac{5}{9}$

Ex: The probability that atleast one of the enents A and B occurs is 0.8 and the probability that both the events occur simultaneously is 0.25 find the probability $P(\overline{A}) + P(\overline{B})$.

(a) 0.65 (b) 0.85 (c) 0.95 (d) 0.5

Sol:
$$P(A \cup B) = 0.8$$
, $P(A \cap B) = 0.25$
 $P(A \cup B) = P(A) + P(B) - P(A \cap B)$
 $\Rightarrow P(A) + P(B) = P(A \cup B) + P(A \cap B)$
 $= 0.8 + 0.25 = 1.05$
 $\Rightarrow 1 - P(\overline{A}) + 1 - P(\overline{B}) = 1.05$
 $\Rightarrow 2 - (P(\overline{A}) + P(\overline{B})) = 1.05$
 $\Rightarrow P(\overline{A}) + P(\overline{B}) = 2 - 1.05 = 0.95$

Ex: The word ASSASIN is given. It is regarded so that the three S's come consecutively. Find the probability of this event.

$$n(s) = \frac{LI}{(3 L)^2} = \frac{7 \times 6 \times 5 \times 4}{2 \times 1} = 420$$

$$n(F) = \frac{LS}{L^2} = SX + X3 = 60$$

$$P(E) = \frac{60}{420} = \frac{1}{7}$$

Ex: If a number of two degets is burned with the digets 2, 3, 5, 7, 9 without refetition of digets, what is the probability that the number burned is 35

$$(9) \frac{1}{16}$$

$$(b)$$
 $\frac{1}{20}$

Sol:
$$h(E) = h(E)$$
 $h(E) = 1$, $h(S) = 5p_2 = \frac{C}{3} = 20$

Ex: There are 4 envelops corresponding to 4 litters. If the litters are placed in the envelopes at random, what is the probability that all the litters are not placed in the right envelopes?

(a) 1/4 (b) 1/24 (c) 23/24 (d) none of these

So(: n(s) = 14 = 24

E: The event that all the letters are placed in the right envelop.

$$P(\overline{E}) = 1 - P(E) = 1 - \frac{n(E)}{n(S)} = 1 - \frac{1}{24} = \frac{23}{24}$$

Ex! The odds in Favour of standing birst of three students appearing at an examination are 1:2, 2:5, and 1:7 respectively. What is the probability that eether of them will stand birst.

Let the three students be P, B, R, birst of the three students P, Q, R respectively $P(A) = \frac{1}{1+2} = \frac{1}{3}$, $P(B) = \frac{2}{2+5} = \frac{2}{7}$ $P(c) = \frac{1}{1+7} = \frac{1}{8}$ P(AUBUC) = P(A) + P(B) + P(C) $= \frac{1}{3} + \frac{1}{7} + \frac{1}{8} = \frac{125}{168}$
